

MAGIX

We can put all Agents into a single register and assume they all have names thus don't need to model name here

These pairs can all just be Concepts in vocabs
thus we don't need specialised class types for them all

Can we reduce a number of these properties to just key/value pairs in a description filed filled with JSON? Just retain major object like Geometry in RDF?

Back-end logic could compound all these into one schema:description predicate value.

If they need to be differentiable, then schema:comment with Blank Nodes and values & roles will be needed

Methods/procedure vocab for all of these
and see if all their properties can fold into SKOS

Method variants can just be narrower methods of other methods

Could have multiple
